TerrAqua

RESTORING MARINE BIODIVERSITY USING
3D PRINTED CLAY REEFS

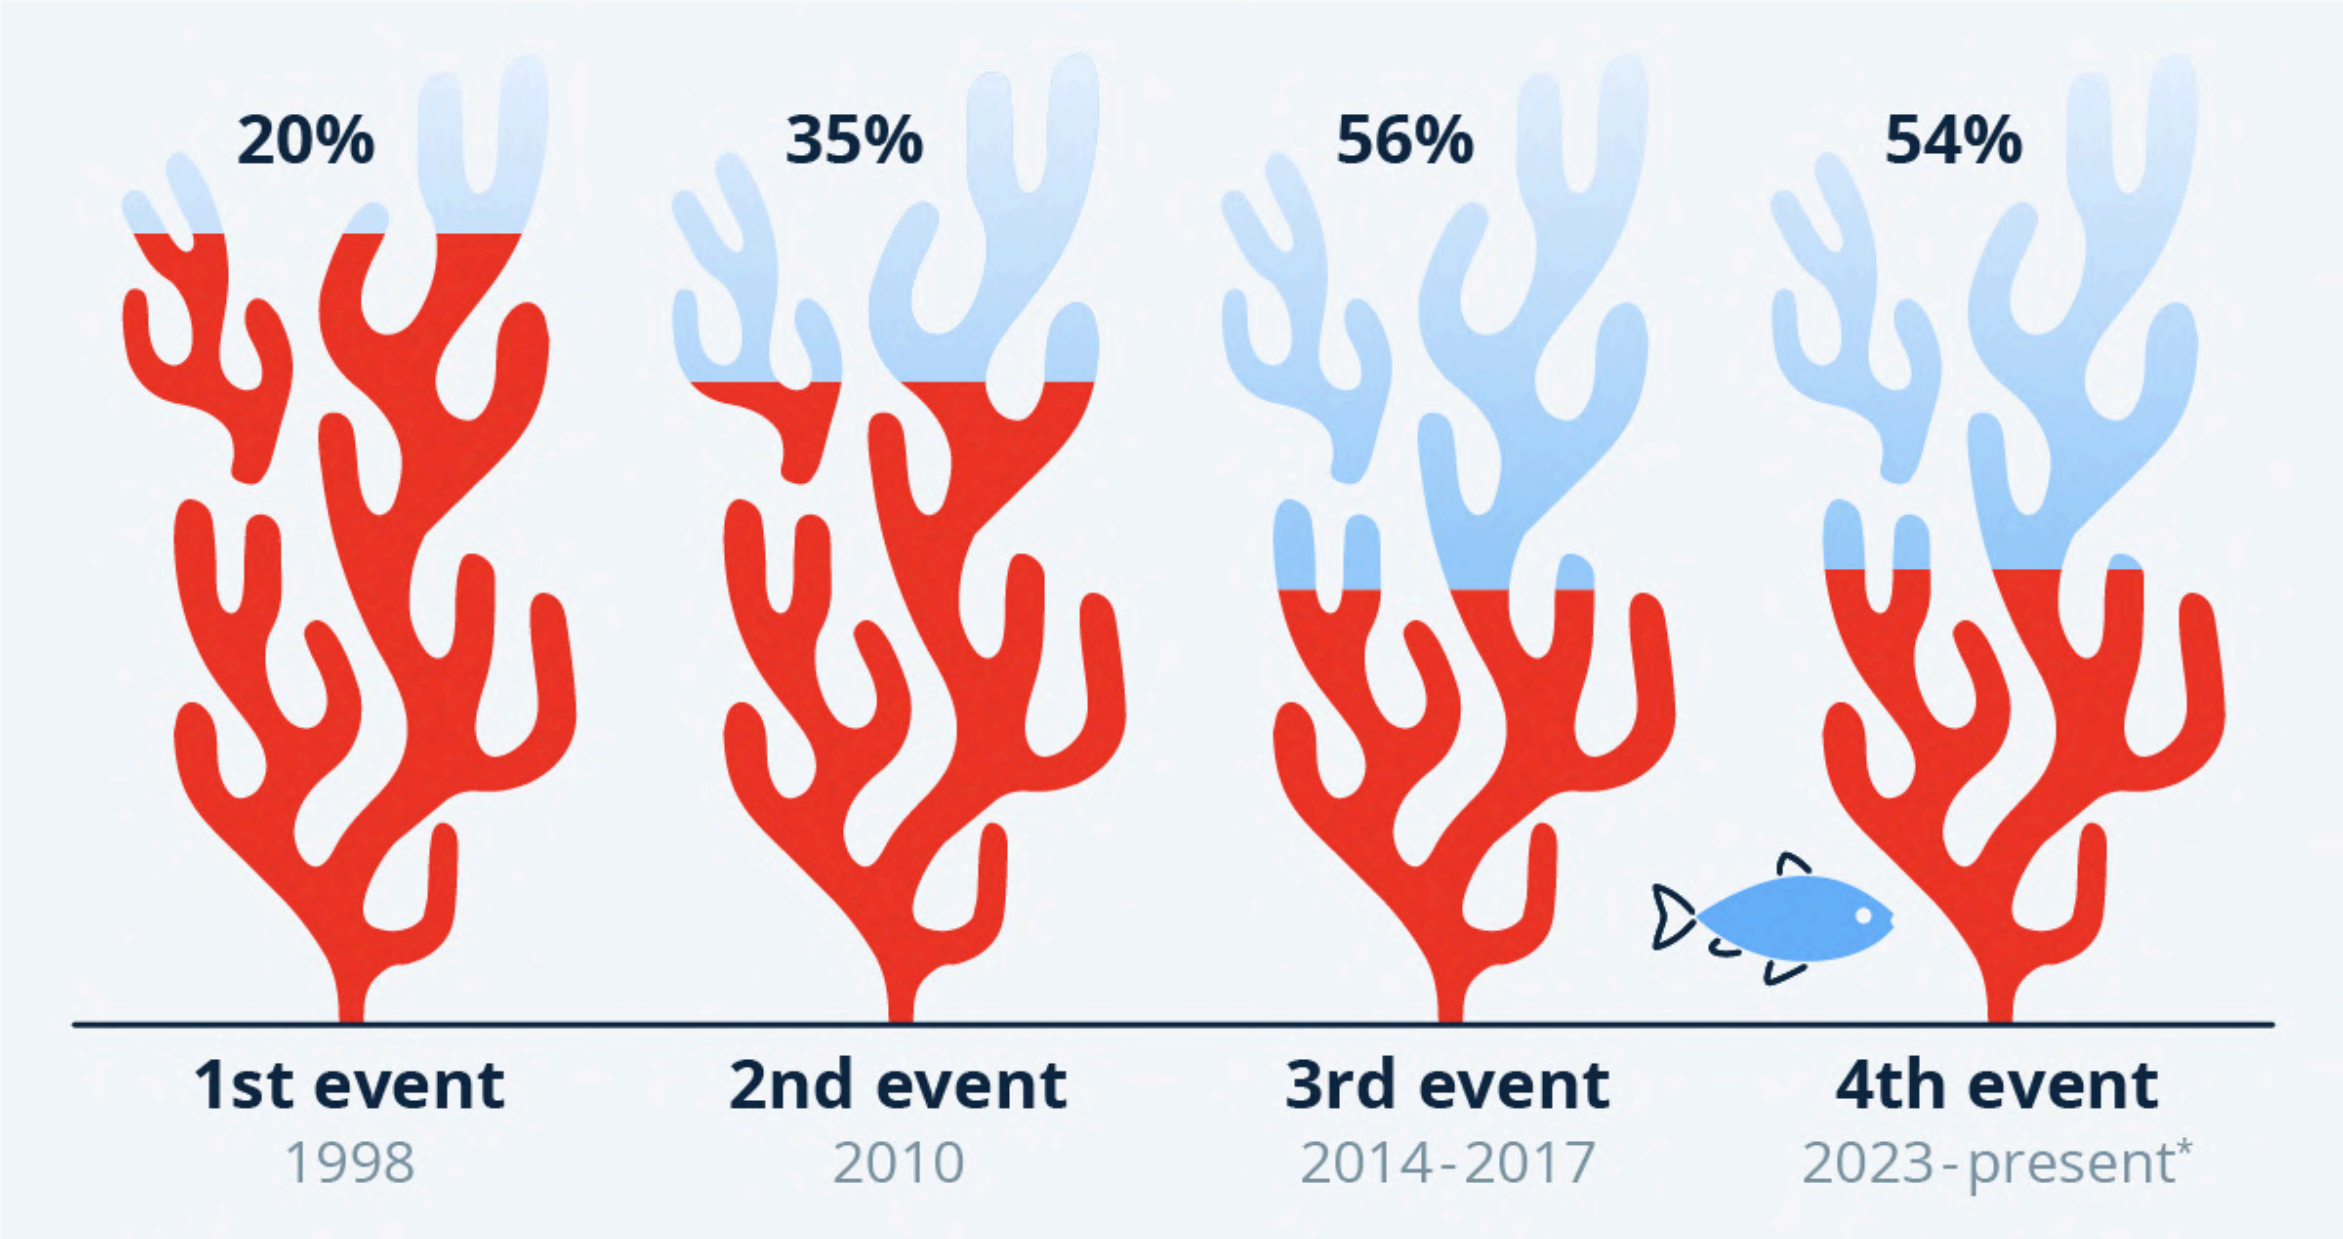

Key Words: Bioremediation | 3D BioPrinting | Regenerative
BioDesign | Conservation | Parametric Architecture | Organic Design

THE PROBLEM

HOLLY ADAMS

SHARE OF CORAL REEFS WORLDWIDE THAT EXPERIENCED HEAT STRESS
CAUSING BLEACHING

0.5°C-1.5°C rise in average sea surface temperature [1]

HOLLY ADAMS

RESEARCH

- fish are more abundant in corals with the **highest levels of complexity**.
- reefs need to be designed for the **particular location, environment and organisms**

RRREEFS

3d printing **customisable clay** reef structures, and empowering communities through science, art and education.

REEF DESIGN LAB

3D printed reef structures made from **eco-concrete, oyster shells** or other **recycled** materials.

COASTRUCTION

3d printing using natural materials aiming for the lowest CO2 footprint possible. Ideally, **local materials** such as **beach sand** or **recycled concrete**.

HOLLY ADAMS

THE SOLUTION

3D PRINTED CLAY CORAL REEF ECOSYSTEM

Aim: Using **advanced manufacturing** technology and **digital fabrication** techniques to design a **modular** structure which aims to **promote marine biodiversity** through the use of a **triply periodic minimal surface**

G

COLLABORATION & LOCATION

RRREEFS

- 'rethink, rebuild and regenerate' our approach to helping coral reefs survive the climate and biodiversity crisis

PUJADA BAY, PHILIPPINES

10% of the Worlds coral reefs
98% are classified 'threatened'

- deployed 820 3D-printed terracotta modules

HOLLY ADAMS

MATERIAL FABRICATION

RRReefs[1]
3D Printed Reef [2]

IAAC - TerraPerforma[3]

3D Printed Oyster Shell [4]

HOLLY ADAMS

GEOMETRY & 3D MODELLING

3D AI GENERATION - Tripo3D

Gyroid (TPMS)

- great strength:weight and surface:volume
- **durable** and **resilient**
- efficient material usage
- varying **heights**, **channels** and **high surface area**

DEFORMED GYROID EXPLORATION - Houdini

HOLLY ADAMS

THE FUTURE ECOSYSTEM

SCALE: ≥1m x 1m x varied

Fire Coral
Found in shallow reefs, with optimum level of sunlight and a variance in the flow of water

Blue Angel Fish
Prefer dimly lit areas or under overhanging vegetation

Seagrass
Critical marine ecosystem providing habitat and diverse communities

Ghost Pipefish
Found in shallow reefs and seagrass meadows where they can hide

Terracotta
pH 8.1

Clown Fish and Anemones
Found in warm sheltered waters. Clownfish live symbiotically with the anemone

Hammer Coral
Typically found in shallow waters on rocky substrates. They Don't require much light

Mandarin Fish
Found in shallow protected reefs with rocky rubble

Capnella
Found in shadier places and on coral rubble in shallow water

HOLLY ADAMS

EDUCATE

TAKE ACTION

INTERACT

REDUCE

ACTIONS

Ecosystem revival and climate protection is not solved by one design and person, but by collaborative action and education.
